

SimPy

SimPy – A Discrete Event Simulation Package in Python

Dr. Klaus G. Müller (kgmuller at xs4all.nl)

EuroSciPy 2008 Leipzig, 26-27 July, 2008

About SimPy

- A Discrete Event Simulation (DES) package
 - Process based
 - Object oriented
 - Modeled after Simula and Simscript
- Written in Python
 - The **only** DES package in Python
- Open Source (LGPL)
- Development since 2002
 - Prof. Tony Vignaux (Lead user specs, documentation),
Dr. Klaus Müller (Lead software)
 - International community of contributors

- Discrete-event simulation (DES):
 - operation of a system is modeled as a chronological sequence of events
 - Each event occurs at an instant in time and marks a change of state in the system
- Used to perform “what if” studies (experiments) of existing or planned systems by executing model on computer

What has SimPy been used for?

- Teaching system simulation and Operations Research courses (universities in New Zealand, US, Canada, Venezuela, Spain, . . .)
- Simulation of epidemics
- Simulation of communications systems
- Simulation of computer hardware performance
- Simulation of nuclear processing facilities in support of designing safeguards for nuclear non-proliferation
- Comparison of Personal Rapid Transit (PRT) and classic rapid transit systems
- Simulation of air space surveillance
- Simulation of telescope management in observatory
-
- ? ? ? ?

SimPy benefits

- Open Source
- Totally written in Python
- Source code and –documentation part of distribution
 - Insight
 - Extensibility
- Clean, small API
- Easy to use, flat learning curve
- Extensive documentation, course-tested

Quotes from a user

- ☺ “coded in less than an hour; more than 8 hours for a similar Java SSJ simulation”
- ☺ “31 lines for a complete queuing simulation with statistics”
- ☺ “more than 200 lines for a similar Java SSJ simulation”
- ☹ “performance is an order less than a similar Java SSJ simulation”

From www.sic.rma.ac.be/~flapierr/divers/SimPy.pdf

SimPy and Co-Routines in Python

- SimPy basis: co-routines allow cooperative multitasking
- Co-routines
 - multiple entry points; suspending and resuming of execution at certain locations
- Python has generators
 - generator looks like a function but behaves like an iterator
- `yield` statement passes a value back to a parent routine
- Co-routines in SimPy
 - generators+dispatcher routine

SimPy Models Processes by Co-Routines

- SimPy simulations
 - Interactions/synchronizations between process entities over time
 - At every synchronization point (event), process entity releases control to dispatcher by `yield` with payload
 - Example: `yield hold, self, tDelay`
- SimPy process entity
 - Class instance data = process state variables
 - Generator = Process Execution Method
 - A process' lifecycle

A SimPy Process and its Activation

```

1  import SimPy.Simulation as Sim
2  class Car(Sim.Process):
3      def drive(self):
4          """This is the Process Execution Method, a generator"""
5          while True:
6              #drive for 10 time units
7              yield Sim.hold,self,10
8              #go to sleep
9              yield Sim.passivate,self
10         .....
11     #create a Car instance
12     c=Car()
13     #activate this car's process in 15 time units
14     Sim.activate(c,c.drive(),at=15)

```

SimPy Co-Routine Machinery

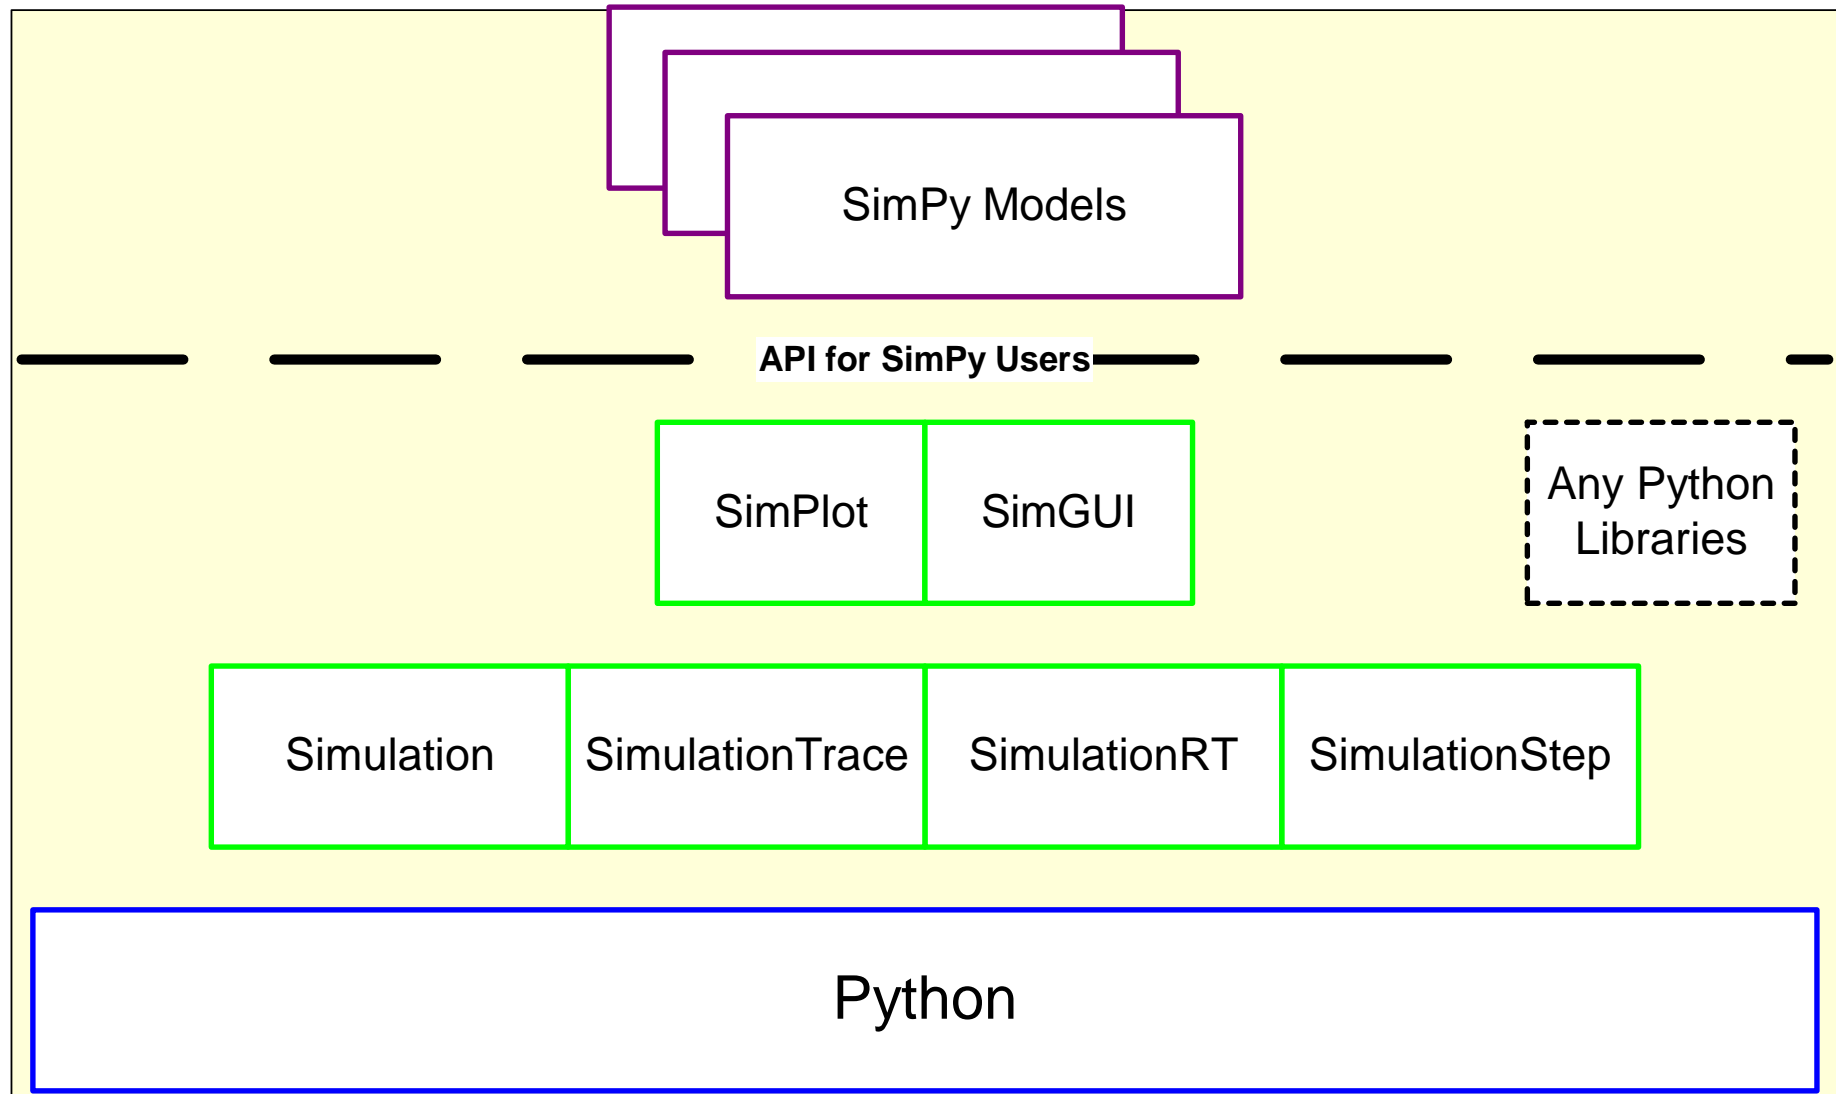

```
1  hold=0; passivate=1 ## and many more function codes
2  events=[]
3  tNow=0.0
4  def post(who,when): ##Schedule next activation for process 'who'
5      events.append((when,who)); events.sort()
6  def activate(who,generator,when=0): ## Make new process runnable
7      who.nextpoint=generator
8      post(who,when) ## first event for "who"
9  def holdfun(who,delay):
10     post(who,tNow+delay) ## next event for "who"
11  def passivatefun(who,ignored=None):
12     pass ## no scheduled event for "who"; wait for wakeup
13  def simulate(tUntil): ## Activate co-routines in time order
14     global tNow
15     dispatch={hold:holdfun,passivate:passivatefun} #etc
16     while events and tNow<tUntil:
17         activationTime,who=events.pop(0)
18         tNow=activationTime
19         try:
20             nextEvent=who.nextpoint.next() ## pass control to "who"
21             actioncode,who,actionpar=nextEvent ## the yield payload
22             dispatch[actioncode](who,actionpar) ## execute command
23         except StopIteration: who.nextpoint=None ## "who" terminated
```

Process Synchronizations in SimPy

- A SimPy process can wait for
 - fixed time period (a delay)
 - re-activation by another process
 - resource to become available
 - event to be signaled
 - general condition (predicate of state variables)
- It can
 - (Re-)activate another process
 - Put itself to sleep
 - Put another process to sleep
 - Interrupt another process
 - Preempt another process queuing for a resource

SimPy Module Structure and User API

- Simulation modules
 - `SimPy.Simulation` : Discrete Event Simulation (DES)
 - `SimPy.SimulationTrace`: DES with event trace
 - `SimPy.SimulationRT`: DES with real time synchronization
 - `SimPy.SimulationStep`: DES with event stepping under user control
- SimPy utility modules
 - `SimPy.SimGUI`: Simulation GUI API
 - `SimPy.SimPlot`: Basic plotting API

SimPy.Simulation: Discrete Event Simulation

Needed for DES	SimPy.Simulation provides
Entities	class Process, class Resource, class Store, class Level
Data collectors	class Monitor, class Tally
Stochastic distributions	Python's Random library
Scheduler entity	Dispatch loop in function <code>simulate</code>
Quasi-parallelism	Co-routines, based on Python generators

A SimPy Example: Problem Scenario

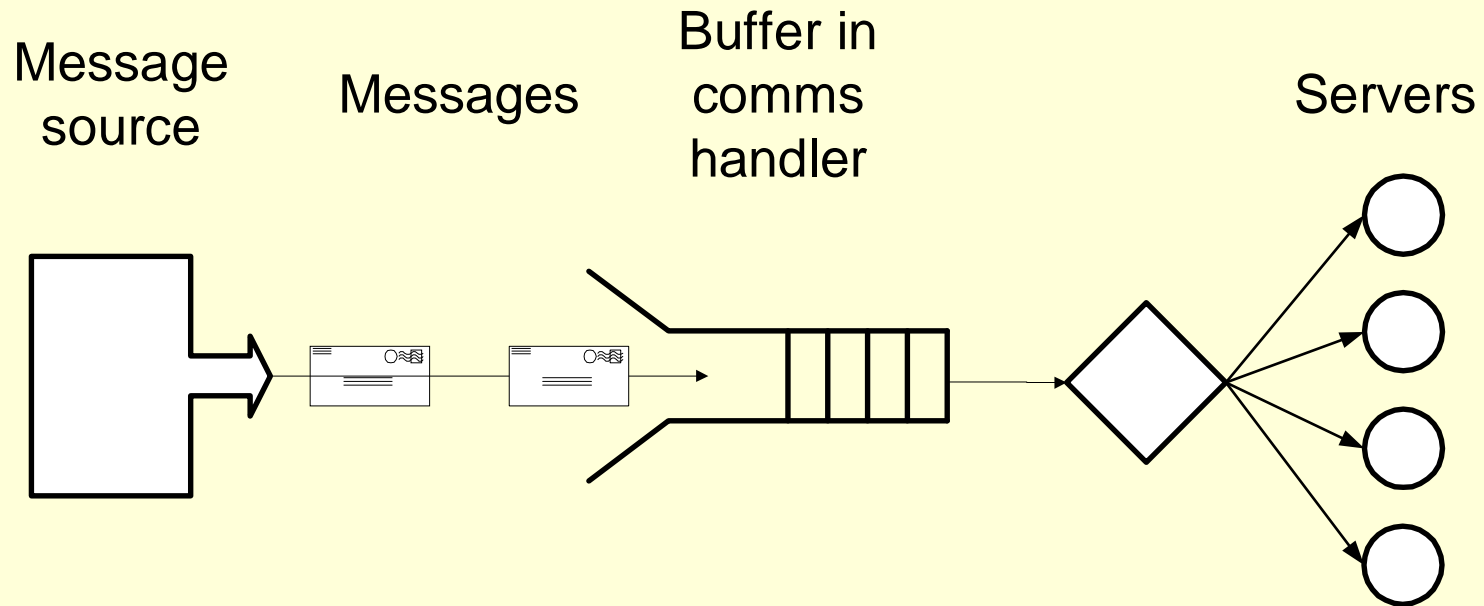

- Messages arrive in a LAN at a rate of about 1/minute (calculated from 1000 data points collected)
- They are processed by 2 **expensive** servers at 1 minute/message
- ***To investigate:***
Could 4 **cheaper, slower** servers (2 min./message) do at least the same job?
 - **Figures of merit:**
 - **Message delays**
 - **Nr of messages delayed**

Mapping Example

Model => SimPy Objects

Abstract model

`def generateMessages()`

`Resource(capacity=nrServers)`

`class Message(Process)`

SimPy objects

```

1  import SimPy.Simulation as Sim
2  def generateMessages(datafile,messageHandler,servtime):
3      for item in datafile:
4          p=Message()
5          Sim.activate(p,p.action(messageHandler,servtime),at=float(item))
6  class Message(Sim.Process):
7      def action(self,messageHandler,servtime):
8          tstart=Sim.now()
9          yield Sim.request,self,messageHandler
10         waited=Sim.now()-tstart
11         obs.append((Sim.now(),waited))
12         yield Sim.hold,self,servtime
13         yield Sim.release,self,messageHandler
14  def run():
15      global obs,computers
16      for computers,servtime in ((2,1),(4,2)):
17          obs=[]
18          infile=open(r".\arrFile.txt","r")
19          Sim.initialize()
20          messageHandler=Sim.Resource(capacity=computers,name="servers")
21          generateMessages(infile,messageHandler,servtime)
22          Sim.simulate(until=2000)
23          print "\n%s computers, %s minutes/message" %(computers,servtime)
24          print "%s messages waited; %s mean wait time" \
25              %(len([x for x in obs if x[1]>0]),
26                sum([y[1] for y in obs])/len(obs))
27  run()
28  raw_input("Press any key . . . .")

```

Run!

SimPy.Simulation Example Output

A screenshot of a Windows command prompt window titled "C:\Python25\python.exe". The window displays the output of a SimPy simulation. The text is as follows:

```
2 computers, 1 minutes/message  
288 messages waited; 0.155676993544 mean wait time  
  
4 computers, 2 minutes/message  
139 messages waited; 0.0860792008799 mean wait time  
Press any key . . .
```

SimPy.SimulationTrace: Opening the Black Box

- Insight into parallel processes and their interaction difficult
 - same problem occurs with simulation
- Module **SimulationTrace** traces all events to show what is happening behind the scenes
- Just replace
from SimPy.Simulation import *
with
from SimPy.SimulationTrace import *
- Trace output can be redirected to a file
- Event types to be traced can be selected

```

1  import SimPy.SimulationTrace as Sim
2  def generateMessages(datafile,messageHandler,servtime):
3      for item in datafile:
4          p=Message("Message %s"%float(item))
5          Sim.activate(p,p.action(messageHandler,servtime),at=float(item))
6  class Message(Sim.Process):
7      def action(self,messageHandler,servtime):
8          tstart=Sim.now()
9          yield Sim.request,self,messageHandler
10         waited=Sim.now()-tstart
11         obs.append((Sim.now(),waited))
12         yield Sim.hold,self,servtime
13         yield Sim.release,self,messageHandler
14  def run():
15      global obs,computers
16      for computers,servtime in ((2,1),(4,2)):
17          Sim.trace.tchange(outfile=open(r".\message_trace.txt","w"))
18          obs=[]
19          infile=open(r".\arrFile.txt","r")
20          Sim.initialize()
21          messageHandler=Sim.Resource(capacity=computers,name="servers")
22          generateMessages(infile,messageHandler,servtime)
23          Sim.simulate(until=2000)
24          print "\n%s computers, %s minutes/message"%(computers,servtime)
25          print "%s messages waited; %s mean wait time"\
26              %(len([x for x in obs if x[1]>0]),
27                sum([y[1] for y in obs])/len(obs))
28  run()
29  raw_input("Press any key . . . .")

```

SimPy.SimulationRT: Synchronize With Real Time

- For simulation user interaction e.g. in game applications or animation, events should appear to be spaced in real time
- ***SimulationRT*** allows tying simulation time to wall clock time
- Example:
simulate(real_time=True,relSpeed=0.2,until= ...)
 runs 1 simulation time unit in 5 real seconds
- Module works better under Windows than under Unix or Linux
 - Problem stems from `time.clock()`

```

1  import simPy.SimulationRT as Sim
2  import time
3  def generateMessages(datafile,messageHandler,servtime):
4      for item in datafile:
5          p=Message()
6          Sim.activate(p,p.action(messageHandler,servtime),at=float(item))
7  class Message(Sim.Process):
8      def action(self,messageHandler,servtime):
9          tstart=Sim.now()
10         yield Sim.request,self,messageHandler
11         waited=Sim.now()-tstart
12         obs.append((Sim.now(),waited))
13         yield Sim.hold,self,servtime
14         yield Sim.release,self,messageHandler
15         print "tsim=%5.5s (%5.5s wall clock): message done; waited %s min"\
16             %(Sim.now(),time.clock()-tbegin,waited)
17  def run():
18      global obs,computers,tbegin
19      for computers,servtime in ((2,1),(4,2)):
20          obs=[]
21          infile=open(r".\arrFile.txt","r")
22          Sim.initialize()
23          messageHandler=Sim.Resource(capacity=computers,name="servers")
24          generateMessages(infile,messageHandler,servtime)
25          tbegin=time.clock()
26          Sim.simulate(until=2000,real_time=True,rel_speed=1)#1 min=1 sec RT
27          print "\n%s computers, %s minutes/message"%(computers,servtime)
28          print "%s messages waited; %s mean wait time"\
29              %(len([x for x in obs if x[1]>0]),
30                sum([y[1] for y in obs])/len(obs))
31  run()
32  raw_input("Press any key . . . .")

```

Run!

SimPy.SimulationRT

Example Output

```
C:\Python25\python.exe
tsim=1.058 (1.292 wall clock): message done; waited 0.0 min
tsim=2.206 (2.141 wall clock): message done; waited 0.0 min
tsim=2.478 (2.413 wall clock): message done; waited 0.0 min
tsim=3.842 (3.778 wall clock): message done; waited 0.0 min

tsim=25.29 (25.22 wall clock): message done; waited 0.0 min
```

SimPy.SimulationStep: Stepping Event by Event

- For event by event user control
 - Debugging
 - Insertion of events or parameter changes by user
- User-provided callback function gets called for every event

```

1  import SimPy.SimulationStep as Sim
2  def generateMessages(datafile,messageHandler,servtime):
3      for item in datafile:
4          p=Message("Message %s"%float(item))
5          Sim.activate(p,p.action(messageHandler,servtime),at=float(item))
6  class Message(Sim.Process):
7      def action(self,messageHandler,servtime):
8          print "%s: %s activated"%(Sim.now(),self.name)
9          . . . .
10 def callbackUserControl():
11     while True:
12         a=raw_input("[Time=%s]\nSelect one: End run (e), "\
13             "Continue stepping (s), Run to end (r)= "%Sim.now())
14         if a=="e": Sim.stopSimulation();break
15         elif a=="s": return
16         elif a=="r": Sim.stopStepping();break
17         else: print "%s' illegal command"%a
18 def run():
19     global obs,computers
20     for computers,servtime in ((2,1),(4,2)):
21         . . . .
22         Sim.startStepping()
23         Sim.simulate(callback=callbackUserControl,until=2000)
24         print "\n%s computers, %s minutes/message"%(computers,servtime)
25         print "%s messages waited; %s mean wait time"\
26             "%(len([x for x in obs if x[1]>0]),\
27             sum([y[1] for y in obs])/len(obs))
28 run()
29 raw_input("Press any key . . . .")

```

Run!

SimPy.SimulationStep Example Output

SimPy.SimPlot: Plotting Simulation Results

- Simple, out-of-the-box plotting package
- Tkinter-based
 - Derived from Konrad Hinsén's plotting module
- Plots (time,value) time-series data from Monitor instances
- Plot types:
 - Line, bar, step, histogram, scatter
- Basic and advanced API

```

1  import SimPy.Simulation as Sim
2  import SimPy.SimPlot as Plot
3  def generateMessages(datafile,messageHandler,servtime):
4      for item in datafile:
5          p=Message("Message %s"%float(item))
6          Sim.activate(p,p.action(messageHandler,servtime),at=float(item))
7  class Message(Sim.Process):
8      def action(self,messageHandler,servtime):
9          tstart=Sim.now()
10         yield Sim.request,self,messageHandler
11         waited=Sim.now()-tstart
12         obs.observe(t=Sim.now(),y=waited)
13         yield Sim.hold,self,servtime
14         yield Sim.release,self,messageHandler
15  def run():
16      global obs,computers
17      for computers,servtime in ((2,1),(4,2)):
18          obs=Sim.Monitor(name="wait time data",ylab="wait time",tlab="time")
19          infile=open(r".\arrFile.txt","r")
20          Sim.initialize()
21          messageHandler=Sim.Resource(capacity=computers,name="servers")
22          generateMessages(infile,messageHandler,servtime)
23          Sim.simulate(until=2000)
24          plt=Plot.SimPlot()
25          plt.plotStep(obs,color="red",
26          title="%s computers, %s minutes/message; %s messages waited, %4.3f mean wait" \
27          %(computers,servtime,len([x for x in obs.yseries() if x>0]),obs.mean()))
28          plt.mainloop()
29  run()
30  raw_input("Press any key . . . .")

```

Run!

SimPy.SimPlot Example Output

Publication-Quality Plotting with Matplotlib

- SimPlot is only intended as quick, first-level analysis tool
- Not optimal for publication quality plots
 - File format limited to Postscript
 - Limited plot types
- SciPy's Matplotlib is recommended
 - Easy interface to SimPy
 - Great range of plot types/formats
 - Many file formats (PNG, EMF, EPS, PDF, PS, RAW, SVG)

```

1  import SimPy.Simulation as Sim
2  import pylab
3  def generateMessages(datafile,messageHandler,servtime):
4      . . . .
5  class Message(Sim.Process):
6      def action(self,messageHandler,servtime):
7          . . . .
8  def run():
9      global obs,computers
10     obslist=[]
11     for computers,servtime in ((2,1),(4,2)):
12         obs=(Sim.Monitor())
13         . . . .
14         Sim.simulate(until=2000)
15         obslist.append(obs)
16         pylab.subplot(211)
17         pylab.title("Distribution of delays (blue=2 computers, red=4 computers)")
18         n, bins, patches = pylab.hist(obslist[0].yseries(), 5,fc="b")
19         pylab.xlim(0,5);pylab.ylim(0,1000)
20         pylab.ylabel("frequency")
21         pylab.subplot(212)
22         n, bins, patches = pylab.hist(obslist[1].yseries(), 5,fc='r')
23         pylab.xlim(0,5);pylab.ylim(0,1000)
24         pylab.ylabel("frequency");pylab.xlabel("delay (minutes)")
25         pylab.show()
26 run()
27 raw_input("Press any key . . . .")

```

Run!

Matplotlib Example Output

SimPy Release 1.9.1

Documentation in Distribution

- User manual
- “Once over lightly” user manual
- Cheat sheet
- Two tutorials
- Manuals for all simulation and utility libraries
- Source code documentation in HTML
(automatically generated by Epydoc)
- Many SimPy simulation models

SimPy and SciPy

- Collaboration with/visibility in SciPy community sought
- Future SimPy versions will have NumPy, Matplotlib interfaces and documentation
- Inclusion in Enthought SciPy distribution sought
